Active Case Study: Training and Development at StellarTech

Scenario:

StellarTech is a software company with 250 employees. They recently got a big project, but some developers lack cloud computing skills, and teams have communication problems. Employee engagement is also low. The CEO asks HR to plan a training program to fix these issues.

Student Instructions (Simple Version)

Identify Problems: What skills or issues need improvement?

Suggest Training: Decide what kind of training will help (technical or soft skills).

Plan Implementation: How will the training happen without affecting work?

Evaluate Success: How will you know if the training works?

Overcome Challenges: What problems might occur and how will you solve them?

Case Study: Training and Development at StellarTech

StellarTech, though a software company, still needs to improve the skills of its employees in technology. Some of the developers lack the necessary skills in cloud computing. In addition, the teams involved often miscommunicate and poorly engage. Therefore, implementing a proper training or program.

In order to address these issues, HR must plan a training program. One training to consider is Cloud computing training to enhance technical skills. This training bridges the immediate competency gap for the new project. In addition, enhancing soft skills for Interpersonal Communication & Agile Teamwork must also be implemented. Through this training, miscommunication and poor engagement can be resolved, ensuring smoother collaboration across teams.

Furthermore, to avoid disrupting the 250-employee workforce during a major project, HR should use a Blended Learning model. They may conduct micro-learning, 15-minute daily modules on cloud computing that developers can complete at their desks. In addition, soft skills training is held in small groups at different times of the week to ensure the office is never understaffed. Lastly, providing "safe" cloud environments where developers can practice without risking the live project data.

Although this training and development program is for the employees, they still might resist it. Some employees might feel overwhelmed by the extra work, posing a great challenge for the company's development. The best solution for this is to provide an incentive, like Cloud Badges" or small bonuses, for those employees who completed the training. In addition, time

constraints might also pose serious risk. To solve this challenge, it's best thing to make the training part of the official "billable hours" so employees don't feel they are losing personal time.

Optional Questions:

1. Should training focus more on technical or soft skills?
The training should be focus in soft skills. Although it's often overlooked, soft skills like communication skills is necessary for a better workplace environment. A non-toxic environment is what attracts employees
2. How can HR motivate employees to join?
HR can use Gamification and Career Pathing. By showing employees that learning cloud computing makes them more valuable in the market (increasing their future earning potential) and offering rewards for finishing modules, the training becomes an opportunity rather than a chore.
3. How can success be measured?
Beyond the project's technical success, HR should track the Employee Net Promoter Score (eNPS) to see if engagement has increased. Technically, success is measured by a reduction in "bugs" or deployment errors in the new cloud-based project.
